

2012 Annual

Water Quality Report

Rosemont

PWS ID: 3410034

CALIFORNIA
AMERICAN WATER

Este informe contiene información muy importante sobre su agua potable. Tradúzcalo o hable con alguien que lo entienda bien.

Mahalaga ang impormasyong ito. Mangyaring ipasalin ito.

A Message from California American Water President Rob MacLean

To Our Valued Customer:

California American Water is proud to be your local water service provider and I am pleased to share good news with you about the quality of the water we deliver to your home. Each year, we provide you with our Annual Water Quality Report – and like so many years prior – we continue to supply water that meets or surpasses all state and federal water quality regulations. This means the water we provide to your home, for about a penny a gallon, is high quality and an exceptional value.

This is no small task. Getting water from the source, to treatment and to your home is more complicated than many people imagine. It includes the miles of pipeline hidden below the ground, the facilities that draw water from the source and the treatment and testing of the water.

Our treatment plant operators, water quality experts, engineers, and maintenance crews work around the clock to make sure that water is always there when you need it. Delivering high-quality, reliable water service to your tap also requires significant investment in our water infrastructure to upgrade aging facilities. In 2012 alone, we invested more than \$46 million in water system improvements statewide. These investments are made directly into infrastructure in your community, to upgrade local facilities.

We do this because we believe we're delivering more than just water service. We deliver a key resource for public health, fire protection, the economy and overall quality of life. Our job is to ensure that quality water keeps flowing not only today, but well into the future. It's part of our commitment to you and the communities we serve.

We hope you agree, it's worth every penny and worth learning more about. Please, take the time to review this report. It provides details about the sources and quality of your drinking water using the data from water quality testing conducted in your water system through December 2012. For an electronic copy of this report, visit us on line at: www.amwater.com/caaw/. Thanks for allowing us to serve you.

Sincerely,

Rob G. MacLean
President, California American Water

Continuing our Commitment

Once again, we proudly present our Annual Water Quality Report. This document covers compliance testing completed through December 2012. We are pleased to tell you that our compliance with state and federal drinking water regulations remains exemplary. As in the past, we are committed to delivering the best quality drinking water. To that end, we remain vigilant in meeting the challenges of source water protection, water conservation, and community education while continuing to serve the needs of all our water users.

California American Water, a wholly owned subsidiary of American Water (NYSE: AWK), provides high-quality and reliable water and/or wastewater services to approximately 600,000 people. California American Water, with the support of American Water, has the technical support of a global network and the local knowledge to provide the highest quality water with personal service.

Founded in 1886, American Water is the largest publicly traded U.S. water and wastewater utility company. With headquarters in Voorhees, N.J., the company employs approximately 6,700 dedicated professionals who provide drinking water, wastewater and other related services to an estimated 14 million people in more than 30 states, and

American Water Works Company, Inc., together with its subsidiaries, is referred to as American Water. "California American Water" and the star logo are the registered trademarks of American Water Works Company, Inc. All rights reserved.

WE CARE ABOUT WATER. IT'S WHAT WE DO.®

parts of Canada. More information can be found by visiting www.amwater.com.

What is a Water Quality Report?

To comply with state and U.S. Environmental Protection Agency (USEPA) regulations, California American Water issues a report annually describing the quality of your drinking water. The purpose of this report is to raise your understanding of drinking water and awareness of the need to protect your drinking water sources.

In 2012 we conducted tests for over 250 contaminants at numerous sampling points in your water system, all of which were below state and federal maximum allowable levels. This report provides an overview of last year's (2012) water quality. It includes details about where your water comes from and what it contains. The data presented in this report is a combination of data from our nationally recognized main water quality lab and commercial laboratories, all certified in drinking water testing by the California Department of Public Health.

If you have any questions about this report or your drinking water, please call our Customer Service Center at (888) 237-1333.

About Your Water

Water in the Rosemont system comes from deep wells that pump groundwater from aquifers here in the Sacramento Valley. California American Water chlorinates your drinking water to ensure that it meets bacteriological quality standards, and also fluoridates it to promote dental health. The water supply is distributed for residential and commercial use. In late 2012, California American Water's permit application to merge the former Suburban and Rosemont Systems was approved by the California Department of Public Health. The merger to form the new Suburban - Rosemont System included bringing in supplemental surface water from the City of Sacramento through our newly constructed Folsom Booster Pump Station. After several years of planning, permitting and construction, completion of this project provides California American Water with greater flexibility to; offset the impact of groundwater contamination in the Suburban - Rosemont System, meet the water supply demands of our customers and, increase our involvement in regional conjunctive-use efforts.

Share This Report

Landlords, businesses, schools, hospitals and other groups are encouraged to share this important water quality information with water users at their location who are not billed customers of California American Water and therefore do not receive this report directly.

Notice of Source Water Assessment

An assessment of the drinking water sources in the Rosemont system was completed in February 2003. The sources are considered most vulnerable to the following

activities (associated with detected chemicals): sewer collection systems.

Although not associated with any detected chemicals the sources are also considered vulnerable to automobile gas stations, dry cleaners, high-density housing, parking lots/malls, historic gas stations, underground storage tanks – confirmed leaking tanks, automobile repair shops, and known contaminant plumes.

A copy of the completed assessment may be viewed at: California American Water; 4701 Beloit Drive; Sacramento, CA 95838.

How to Contact Us

If you have any questions about this report, your drinking water, or service, please call our Customer Service Center toll free at (888) 237-1333.

What Are the Sources of Contaminants?

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals, and in some cases, radioactive material, and can pick up substances resulting from the presence of animals or human activity.

Contaminants that may be present in source water include:

Microbial Contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.

Inorganic Contaminants, such as salts and metals, can be naturally-occurring, or may result from urban stormwater

runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.

Pesticides and Herbicides, which may come from a variety of sources, such as agriculture, urban stormwater runoff, and residential uses.

Organic Chemical Contaminants, including synthetic and volatile organic chemicals that are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, agricultural application, and septic systems.

Radioactive Contaminants, which can be naturally-occurring, or may be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the USEPA and the California Department of Public Health (Department) prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. Department regulations also establish limits for contaminants in bottled water that must provide the same protection for public health.

Radon

Radon is a radioactive gas that you cannot see, taste, or smell. It is found throughout the United States. Radon can move up through the ground and into a home through cracks and holes in the foundation. Radon can build up to high levels in all types of homes. Radon can also get into indoor air when released from tap water when showering, washing dishes, or doing other household activities with water. Compared to radon entering the home through soil, radon entering the home through tap water in most cases will be a minor source in indoor air. Radon is a known human carcinogen. Breathing air containing radon can lead to lung cancer. Drinking water containing radon may also cause increased risk of stomach cancer. If you are concerned about radon in your home, test the air inside. Testing is inexpensive and easy. You should pursue radon removal for your home if the level of radon in your air is 4 picocuries per liter of air (pCi/L) or higher. There are simple ways to fix a radon problem that are not too costly. For additional information, call your state radon program (800) 745-7236, the USEPA Safe Drinking Water Hotline (800) 426-4791, or the National Safety Council's Radon Hotline (800) SOS-RADON.

Source Water Protection Tips for Consumers

Protection of drinking water is everyone's responsibility. You can help protect your community's drinking water sources in several ways:

- Eliminate excess use of lawn and garden fertilizers and pesticides - they contain hazardous chemicals that can reach your drinking water sources.
- Pick up after your pets.

- Dispose of chemicals properly, take used motor oil to a recycling center.
- Do not dispose of unused medications down the drain.
- Use environmentally friendly soaps and detergents when washing your vehicles.

Educational Information – Special Health Information

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. You can obtain more information about contaminants and potential health effects by calling the USEPA's Safe Drinking Water Hotline (800) 426-4791.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants may be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA and the Centers for Disease Control and Prevention (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the USEPA's Safe Drinking Water Hotline (800) 426-4791.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. California American Water is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been idle for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>.

How to Read This Table

California American Water conducts extensive monitoring to ensure that your water meets water quality standards. The results of our monitoring are reported in the adjacent tables. While most of our monitoring was conducted in 2012, certain substances are monitored less than once per year because the levels do not change frequently. For help with interpreting this table, see the "Definition of Terms" section.

Starting with a **Substance**, read across. **Year Sampled** is usually 2012 or the most recent data from a prior year. **MCL** shows the highest level of the substance (contaminant) allowed. **PHG** (or **MCLG**) is the goal level for that substance (this may be lower than what is allowed). **Average Amount Detected** represents the (calculated) average level of that substance from the drinking water sources that California American Water used in 2012. **Range** tells the highest and lowest amounts measured. A **No** under **Violation** indicates that regulatory requirements were met. **Major Sources in Drinking Water** tells where the substance usually originates.

Definitions of Terms Used in This Report

- **AL (Action Level):** The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.
- **MCL (Maximum Contaminant Level):** The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHGs (or MCLGs) as is economically and technologically feasible.
- **MCLG (Maximum Contaminant Level Goal):** The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs are set by the USEPA.
- **MRDL (Maximum Residual Disinfectant Level):** The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.
- **MRDLG (Maximum Residual Disinfectant Level Goal):** The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.
- **NA:** Not applicable
- **ND:** Not detected
- **NTU (Nephelometric Turbidity Units):** Measurement of the clarity, or turbidity of the water.
- **Notification Level:** The concentration of a contaminant, which, if exceeded, requires notification to the California Department of Public Health and the consumer. Not an enforceable standard.
- **pCi/L (picocuries per liter):** Measurement of the natural rate of disintegration of radioactive contaminants in water (also beta particles).
- **PDWS (Primary Drinking Water Standard):** MCLs and MRDLs for contaminants that affect health along with their monitoring and reporting requirements, and water treatment requirements.
- **pH:** A measurement of acidity, 7.0 being neutral.
- **PHG (Public Health Goal):** The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.
- **ppb (parts per billion):** One part substance per billion parts water, or micrograms per liter.
- **ppm (parts per million):** One part substance per million parts water, or milligrams per liter.
- **SMCL (Secondary Maximum Contaminant Level):** SMCLs are set to protect the aesthetic properties of drinking water (odor, taste and appearance).
- **TON:** Threshold Odor Number.
- **Total Dissolved Solids:** An overall indicator of the amount of minerals in water.
- **µmhos/cm (micromhos per centimeter):** A measure of electrical conductance.

Water Quality Statement

Last year, as in years past, your tap water met USEPA and state drinking water standards. California American Water vigilantly safeguards its water supplies, and once again we are proud to report that our system did not violate any state or federal water quality standards.

Water Quality Results

Regulated Substances

Substance (units)	Year Sampled	MCL	PHG (MCLG)	Average Amount Detected	Range Low-High	Violation	Major Sources in Drinking Water
Arsenic (ppb)	2012	10	0.004	ND	ND - 3	No	Erosion of natural deposits; Runoff from orchards; Glass and electronics production wastes
Barium (ppm)	2012	1	2	ND	ND - 0.10	No	Discharge of drilling wastes; Discharge from metal refineries; Erosion of natural deposits
Nitrate as NO ₃ (ppm) ¹	2012	45	45	14.3	ND - 27.7	No	Runoff and leaching from fertilizer use; Leaching from septic tanks and sewage; Erosion of natural deposits
Gross Alpha Particle Activity (pCi/L)	2012	15	(0)	ND	ND - 8.86	No	Erosion of natural deposits
Uranium (pCi/L) ²	2012	20	0.43	6.9	4.1 - 8.80	No	Erosion of natural deposits
Distribution System Monitoring							
Chlorine (ppm)	2012	MRDL = 4.0	MRDLG = 4.0	0.39	0.37 - 0.42	No	Drinking water disinfectant added for treatment
Fluoride (ppm) ³	2012	0.7 - 1.3 ⁴	NA	0.9	0.4 - 1.1	No	Water additive that promotes strong teeth
Total Trihalomethanes (TTHM) (ppb)	2012	80	NA	0.6 ⁵	ND - 2.7	No	By-product of drinking water disinfection

Secondary Substances

Substance (units)	Year Sampled	SMCL	Average Amount Detected	Range Low-High	Violation	Typical Source
Chloride (ppm)	2012	500	12.4	4.8 - 19.1	No	Runoff/leaching from natural deposits; Seawater influence
Iron (ppb)	2012	300	ND	ND - 220	No	Leaching from natural deposits; Industrial wastes
Manganese (ppb)	2012	50	ND	ND - 65	No	Leaching from natural deposits
Specific Conductance (µmhos/cm)	2012	1,600	371	200 - 500	No	Substances that form ions when in water; Seawater influence
Sulfate (ppm)	2012	500	12.4	ND - 29.8	No	Runoff/leaching from natural deposits; Industrial wastes
Total Dissolved Solids (ppm)	2012	1,000	234	150 - 320	No	Runoff/leaching from natural deposits
Turbidity (NTU)	2012	5	ND	ND - 0.55	No	Soil runoff
Zinc (ppm)	2012	5	ND	ND - 0.06	No	Runoff/leaching from natural deposits; Industrial wastes

Lead and Copper (tap water samples)

Substance (units)	Year Sampled	Action Level	PHG (MCLG)	Number of Samples	Amount Detected at 90 th Percentile	Homes Above Action Level	Violation	Typical Source
Copper (ppm)	2010	1.3	0.3	30	0.059	0	No	Internal corrosion of household plumbing systems; Erosion of natural deposits; Leaching from wood preservatives
Lead (ppb)	2010	15	0.2	30	2.0	0	No	Internal corrosion of household plumbing systems; Erosion of natural deposits; Discharges from industrial manufacturers

Additional Water Quality Parameters of Interest

This table shows average levels of additional water quality parameters which are often of interest to consumers. The averages shown here are calculated from the levels detected at each source and used to supply water in 2012. Values may vary from day to day. There are no health-based limits for these substances in drinking water.

Additional Constituents

Substance (units)	Year Sampled	Average Amount Detected	Range Low-High
Alkalinity as CaCO ₃ (ppm)	2012	138	80 - 190
Calcium (ppm)	2012	41	22 - 62
Magnesium (ppm)	2012	13	5 - 21
pH	2012	8.1	8.0 - 8.3
Radon (pCi/L)	2006	385	163 - 616
Silica (ppm)	2012	50	41 - 67
Sodium (ppm)	2012	14	10 - 21
Total Hardness as CaCO ₃ (ppm)	2012	158	77 - 230
Hexavalent Chromium (ppb) ⁶	2011	3.21	ND - 4.63

¹ Nitrate in drinking water at levels above 45 mg/L is a health risk for infants less than six months of age. Such nitrate levels in drinking water can interfere with the capacity of the infant's blood to carry oxygen, resulting in a serious illness; symptoms include shortness of breath and blueness of the skin. Nitrate levels above 45 mg/L may also affect the ability of the blood to carry oxygen in other individuals, such as pregnant women and those with certain specific enzyme deficiencies. If you are caring for an infant, or you are pregnant, you should ask advice from your health care provider.

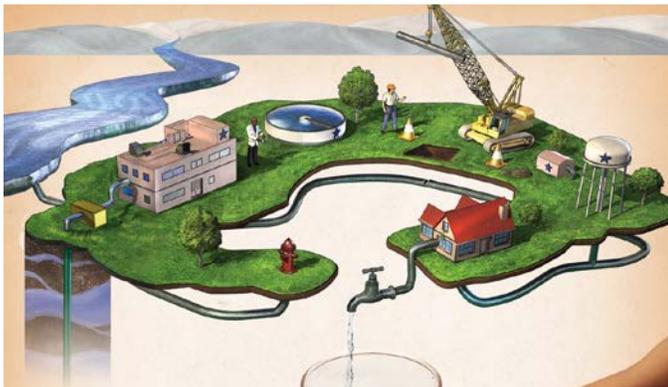

² Uranium monitoring required at only 1 well that was used to supply water to the system in 2012.

³ California American Water adjusts the natural levels of fluoride in our water supplies to the California Department of Public Health's recommended optimum level.

⁴ Fluoride Control Range, not an MCL.

⁵ Highest Running Annual Average.

⁶ In January 2011, the USEPA asked public water systems to conduct voluntary hexavalent chromium monitoring so that they may gain a better understanding of the nature and occurrence of the element. The data presented here are from the first round of monitoring. Additional monitoring will be conducted between 2013 -2015 during the Unregulated Contaminant Monitoring Rule monitoring period. Both the California Department of Public Health (CDPH) and the USEPA are working toward establishing a regulatory standard for hexavalent chromium in drinking water. For more information on what steps American Water is taking in regard to hexavalent chromium, please visit our website at <http://www.amwater.com/caaw/Ensuring-Water-Quality/Chromium-6> For more information on the regulatory process, please follow the link to the CDPH's Hexavalent Chromium web page (www.cdph.ca.gov/certlic/drinkingwater/pages/chromium6.aspx)'

There's a lot more to your water bill than just water.

When you turn on the tap, it's easy to see what your water bill buys. What's not as easy to see is what it takes to bring that water to your home. The miles of pipeline hidden below the ground. The facilities that draw water from the source. The plant where it's treated and tested. The scientists, engineers, and maintenance crews working around the clock to make sure that water is always there when you need it. Your water payments are helping to build a better tomorrow by supporting needed improvements that will keep water flowing for all of us—today and well into the future. All for about a penny a gallon.

AT ABOUT A PENNY PER GALLON WATER IS A GREAT VALUE.™ **WE CARE ABOUT WATER. IT'S WHAT WE DO. FIND OUT WHY YOU SHOULD, TOO, at amwater.com.**
